Validating Transactions

In This Guide

- ❖ Getting Started
- ❖ How does it Work?
- ❖ Additional Methods

Getting Started

What is a validation transaction? The concept of validating transactions comes from the desire to maintain a superb wallet portfolio. To grow, not only your token count but also your total balance as well. The minimum validation amount is 0.000011 going up to as much as 1 full token.

How does it Work?

By validating with micro transactions, a simple swap of 0.000011 from XLM to each trustline you want to "grow" will positively affect your daily token count. Aside from your token count, your balance may also slowly rise. These small daily transactions positively affect the relationship between assets, and the entire Stellar ecosystem by creating liquidity between pairings.

Additional Methods

Try using alternative tokens in place of XLM to build bridges between pairs.

Make validation transactions through Trades with a fraction of, or 1 token.

Make validation transactions by adding a Liquidity Pool with 1 XLM and the trading pair you wish to grow. Remember: Auto-trades can happen in either direction in a Liquidity Pool. The token count of one side going down means the other is going up; you may not see balance results until you remove liquidity.

It is beneficial to use all three methods: Swaps, Trades, and Liquidity Pools.
